4.1.1 Detailed Description

@description These functions specify the API for data compression operations.

Remarks

4.1.2 Macro Definition Documentation

4.1.2.1 QATZIP_API_VERSION_NUM_MAJOR `#define QATZIP_API_VERSION_NUM_MAJOR (2)`

QATzip Major Version Number @description The QATzip API major version number. This number will be incremented when significant changes to the API have occurred. The combination of the major and minor number definitions represent the complete version number for this interface.

4.1.2.2 QATZIP_API_VERSION_NUM_MINOR `#define QATZIP_API_VERSION_NUM_MINOR (3)`

QATzip Minor Version Number @description The QATzip API minor version number. This number will be incremented when minor changes to the API have occurred. The combination of the major and minor number definitions represent the complete version number for this interface.

4.1.2.3 QZ_MAX_STRING_LENGTH `#define QZ_MAX_STRING_LENGTH 64`

QATzip software version structure

@description This structure contains data relating to the versions of a QATZip or a subcomponent of this library platform.

4.1.2.4 QZ_OK `#define QZ_OK (0)`

QATzip Session Status definitions and function return codes

@description This list identifies valid values for session status and function return codes. Success

4.1.2.5 QZ_SKID_PAD_SZ `#define QZ_SKID_PAD_SZ 48`

Get the maximum compressed output length

@description Get the maximum compressed output length.

@context This function shall not be called in an interrupt context. @assumptions None @sideEffects None @blocking Yes @reentrant No @threadSafe Yes

Parameters

<i>in</i>	<i>src_sz</i>	Input data length in bytes sess Session handle (pointer to opaque instance and session data)
-----------	---------------	--

Return values

<i>dest_sz</i>	Max compressed data output length in bytes. When <i>src_sz</i> is equal to 0, the return value is QZ_COMPRESSED_SZ_OF_EMPTY_FILE(34) . When integer overflow happens, the return value is 0
----------------	---

Precondition

None

Postcondition

None

Note

Only a synchronous version of this function is provided.

None

4.1.2.6 QZ_SW_BACKUP_BIT_POSITION `#define QZ_SW_BACKUP_BIT_POSITION (0)`

QATzip Session software configuration settings

@description The following definitions can be used with the `sw_backup` variable in structs and functions to configure the session

`QZ_ENABLE_SOFTWARE_BACKUP` Congifure session with software fallback

`QZ_ENABLE_SOFTWARE_ONLY_EXECUTION` Configure session to only use software

4.1.2.7 QZ_SW_EXECUTION_BIT `#define QZ_SW_EXECUTION_BIT (4)`

QATzip Extended return information

@description The following definitions can be used with the extended return values.

`QZ_SW_EXECUTION` indicates if a request for services was performed in software.

`QZ_HW_TIMEOUT` indicates if a request to hardware was timed out.

If set in the extended return value, `QZ_POST_PROCESS_FAIL` indicates post processing of the LZ4s compressed data has failed.

4.1.3 Typedef Documentation**4.1.3.1 PinMem_T** `typedef enum PinMem_E PinMem_T`

Supported memory types

@description This enumerated list identifies memory types supported by QATzip.

4.1.3.2 QzCrc64Config_T `typedef struct QzCrc64Config_S QzCrc64Config_T`

QATzip CRC64 configuration structure

@description This structure contains data relating to configuration of the sessions CRC64 functionality. Session defaults to using ECMA-182 Normal on creation.

4.1.3.3 QzCrcType_T `typedef enum QzCrcType_E QzCrcType_T`

Supported checksum type

@description This enumerated list identifies the checksum type for input/output data. The format can be CRC32, Adler or none.

4.1.3.4 QzDataFormat_T `typedef enum QzDataFormat_E QzDataFormat_T`

Streaming API input and output format

@description This enumerated list identifies the data format supported by QATzip streaming API. A format can be raw deflate data block, deflate block wrapped by GZip header and footer, or deflate data block wrapped by GZip extension header and footer.

4.1.3.5 QzDirection_T `typedef enum QzDirection_E QzDirection_T`

Compress or decompress setting

@description This enumerated list identifies the session directions supported by QATzip. A session can be compress, decompress or both.

4.1.3.6 QzHuffmanHdr_T `typedef enum QzHuffmanHdr_E QzHuffmanHdr_T`

This API provides access to underlying compression functions in QAT hardware. The API supports an implementation that provides compression service in software if all of the required resources are not available to execute the compression service in hardware.

The API supports threaded applications. Applications can create threads and each of these threads can invoke the API defined herein.

For simplicity, initializations and setup function calls are not required to obtain compression services. If the initialization and setup functions are not called before compression or decompression requests, then they will be called with default arguments from within the compression or decompression functions. This results in several legal calling scenarios, described below.

Scenario 1 - All functions explicitly invoked by caller, with all arguments provided.

```
qzInit(&sess, sw_backup); qzSetupSession(&sess, &params); qzCompress(&sess, src, &src_len, dest, &dest_len, 1); qzDecompress(&sess, src, &src_len, dest, &dest_len); qzTeardownSession(&sess); qzClose(&sess);
```

Scenario 2 - Initialization function called, setup function not invoked by caller. This scenario can be used to specify the sw_backup argument to qzInit.

```
qzInit(&sess, sw_backup); qzCompress(&sess, src, &src_len, dest, &dest_len, 1); calls qzSetupSession(sess, NULL); qzTeardownSession(&sess); qzClose(&sess);
```

Scenario 3 - Calling application simply invokes the actual qzCompress functions.

```
qzCompress(&sess, src, &src_len, dest, &dest_len, 0); calls qzInit(sess, 1); calls qzSetupSession(sess, NULL); qzCompress(&sess, src, &src_len, dest, &dest_len, 1);
```

Notes: Invoking qzSetupSession with NULL for params sets up a session with default session attributed, detailed in the function description below.

If an application terminates without invoking tear down and close functions, process termination will invoke memory and hardware instance cleanup.

If a thread terminates without invoking tear down and close functions, memory and hardware are not cleaned up until the application exits.

Additions for QAT 2.0 and beyond platforms though Extending QzSessionParamsGen3_T, QzDataFormatGen3_T and Using qzSetupSessionGen3 to setup session.

1. Addition of LZ4 and LZ4s
2. Addition of post processing functions for out of LZ4s
3. Compression level up to 12 for LZ4 and LZ4s
4. Support for gzip header with additional compression algorithms

Supported Huffman Headers

@description This enumerated list identifies the Huffman header types supported by QATzip.

4.1.3.7 qzLZ4SCallbackFn typedef int(* qzLZ4SCallbackFn) (void *external, const unsigned char *src, unsigned int *src_len, unsigned char *dest, unsigned int *dest_len, int *ExtStatus)

Post processing callback after LZ4s compression

@description This function will be called in qzCompressCrc for post processing of lz4s payloads. Function implementation should be provided by user and comply with this prototype's rules. The input parameter 'dest' will contain the compressed lz4s format data.

The user callback function should be provided through the QzSessionParams_T. And set data format of compression to 'QZ_LZ4S_FH', then post-processing will be trigger.

qzCallback's first parameter 'external' can be a customized compression context which can be setup before QAT qzSetupSession. It can be provided to QATZip though the 'qzCallback_external' variable in the QzSessionParams_T structure.

ExtStatus will be embedded into extended return codes when qzLZ4SCallbackFn return QZ_POST_PROCESS_ERROR. See extended return code section and *Ext API for details.

@context This function shall not be called in an interrupt context. @assumptions None @sideEffects None @blocking Yes @reentrant No @threadSafe Yes

Parameters

in	<i>external</i>	User context provided through the 'qzCallback_external' pointer in the QzSessionParams_T structure.
in	<i>src</i>	Point to source buffer
in, out	<i>src_len</i>	Length of source buffer. Modified to number of bytes consumed
in	<i>dest</i>	Point to destination buffer
in, out	<i>dest_len</i>	Length of destination buffer. Modified to length of compressed data when function returns
in, out	<i>ExtStatus</i>	'qzCallback' customized error code.

Return values

<i>QZ_OK</i>	Function executed successfully
<i>QZ_FAIL</i>	Function did not succeed
<i>QZ_PARAMS</i>	params are invalid
<i>QZ_POST_PROCESS_ERROR</i>	post processing error

QATzip Stream data storage

@description This structure contains metadata needed for stream operation.

4.1.4 Enumeration Type Documentation

4.1.4.1 PinMem_E enum [PinMem_E](#)

Supported memory types

@description This enumerated list identifies memory types supported by QATzip.

Enumerator

COMMON_MEM	Allocate non-contiguous memory
PINNED_MEM	Allocate contiguous memory

4.1.4.2 QzCrcType_E enum QzCrcType_E

Supported checksum type

@description This enumerated list identifies the checksum type for input/output data. The format can be CRC32, Adler or none.

Enumerator

QZ_CRC32	CRC32 checksum
QZ_ADLER	Adler checksum
NONE	No checksum

4.1.4.3 QzDataFormat_E enum QzDataFormat_E

Streaming API input and output format

@description This enumerated list identifies the data format supported by QATzip streaming API. A format can be raw deflate data block, deflate block wrapped by GZip header and footer, or deflate data block wrapped by GZip extension header and footer.

Enumerator

QZ_DEFLATE_4B	Data is in raw deflate format with 4 byte header
QZ_DEFLATE_GZIP	Data is in deflate wrapped by GZip header and footer
QZ_DEFLATE_GZIP_EXT	Data is in deflate wrapped by GZip extended header and footer
QZ_DEFLATE_RAW	Data is in raw deflate format
QZ_FMT_NUM	

4.1.4.4 QzDirection_E enum QzDirection_E

Compress or decompress setting

@description This enumerated list identifies the session directions supported by QATzip. A session can be compress, decompress or both.

Enumerator

QZ_DIR_COMPRESS	Session will be used for compression
QZ_DIR_DECOMPRESS	Session will be used for decompression
QZ_DIR_BOTH	Session will be used for both compression and decompression

4.1.4.5 QzHuffmanHdr_E enum QzHuffmanHdr_E

This API provides access to underlying compression functions in QAT hardware. The API supports an implementation that provides compression service in software if all of the required resources are not available to execute the compression service in hardware.

The API supports threaded applications. Applications can create threads and each of these threads can invoke the API defined herein.

For simplicity, initializations and setup function calls are not required to obtain compression services. If the initialization and setup functions are not called before compression or decompression requests, then they will be called with default arguments from within the compression or decompression functions. This results in several legal calling scenarios, described below.

Scenario 1 - All functions explicitly invoked by caller, with all arguments provided.

```
qzInit(&sess, sw_backup); qzSetupSession(&sess, &params); qzCompress(&sess, src, &src_len, dest, &dest_len, 1); qzDecompress(&sess, src, &src_len, dest, &dest_len); qzTeardownSession(&sess); qzClose(&sess);
```

Scenario 2 - Initialization function called, setup function not invoked by caller. This scenario can be used to specify the `sw_backup` argument to `qzInit`.

```
qzInit(&sess, sw_backup); qzCompress(&sess, src, &src_len, dest, &dest_len, 1); calls qzSetupSession(sess, NULL); qzTeardownSession(&sess); qzClose(&sess);
```

Scenario 3 - Calling application simply invokes the actual `qzCompress` functions.

```
qzCompress(&sess, src, &src_len, dest, &dest_len, 0); calls qzInit(sess, 1); calls qzSetupSession(sess, NULL); qzCompress(&sess, src, &src_len, dest, &dest_len, 1);
```

Notes: Invoking `qzSetupSession` with `NULL` for `params` sets up a session with default session attributed, detailed in the function description below.

If an application terminates without invoking tear down and close functions, process termination will invoke memory and hardware instance cleanup.

If a thread terminates without invoking tear down and close functions, memory and hardware are not cleaned up until the application exits.

Additions for QAT 2.0 and beyond platforms though Extending `QzSessionParamsGen3_T`, `QzDataFormatGen3_T` and Using `qzSetupSessionGen3` to setup session.

1. Addition of LZ4 and LZ4s
 2. Addition of post processing functions for out of LZ4s
 3. Compression level up to 12 for LZ4 and LZ4s
 4. Support for gzip header with additional compression algorithms
- Supported Huffman Headers

@description This enumerated list identifies the Huffman header types supported by QATzip.

Enumerator

QZ_DYNAMIC_HDR	Full Dynamic Huffman Trees
QZ_STATIC_HDR	Static Huffman Trees

4.1.4.6 QzPollingMode_E enum QzPollingMode_E

Supported polling mode

@description Specifies whether the instance must be busy polling, or be periodical polling.

Enumerator

QZ_PERIODICAL_POLLING	No busy polling
QZ_BUSY_POLLING	busy polling

4.1.4.7 QzSoftwareComponentType_E enum QzSoftwareComponentType_E

Software Component type

@description This enumerated list specifies the type of software that is being described.

Enumerator

4.1.5.2 qzCompress() `QATZIP_API int qzCompress (`
 `QzSession_T * sess,`
 `const unsigned char * src,`
 `unsigned int * src_len,`
 `unsigned char * dest,`
 `unsigned int * dest_len,`
 `unsigned int last)`

Compress a buffer

@description This function will compress a buffer if either a hardware based session or a software based session is available. If no session has been established - as indicated by the contents of *sess - then this function will attempt to set up a session using qzInit and qzSetupSession.

The resulting compressed block of data will be composed of one or more gzip blocks, as per RFC 1952.

This function will place completed compression blocks in the output buffer.

The caller must check the updated src_len. This value will be the number of consumed bytes on exit. The calling API may have to process the destination buffer and call again.

The parameter dest_len will be set to the number of bytes produced in the destination buffer. This value may be zero if no data was produced which may occur if the consumed data is retained internally. A possible reason for this may be small amounts of data in the src buffer.

@context This function shall not be called in an interrupt context. @assumptions None @sideEffects None @blocking Yes @reentrant No @threadSafe Yes

Parameters

in	<i>sess</i>	Session handle (pointer to opaque instance and session data)
in	<i>src</i>	Point to source buffer
in, out	<i>src_len</i>	Length of source buffer. Modified to number of bytes consumed
in	<i>dest</i>	Point to destination buffer
in, out	<i>dest_len</i>	Length of destination buffer. Modified to length of compressed data when function returns
in	<i>last</i>	1 for 'No more data to be compressed' 0 for 'More data to be compressed'
in, out	<i>ext_rc</i>	qzCompressExt only. If not NULL, ext_rc point to a location where extended return codes may be returned. See extended return code section for details. if NULL, no extended information will be provided.

Return values

<i>QZ_OK</i>	Function executed successfully
<i>QZ_FAIL</i>	Function did not succeed
<i>QZ_PARAMS</i>	*sess is NULL or member of params is invalid

`const unsigned char * src,`
`unsigned int * src_len,`
`unsigned char * dest,`
`unsigned int * dest_len,`
`unsigned int last,`
`unsigned long * crc)`

Compress a buffer and return the CRC checksum

@description This function will compress a buffer if either a hardware based session or a software based session is available. If no session has been established - as indicated by the contents of *sess - then this function will attempt to set up a session using qzInit and qzSetupSession.

The resulting compressed block of data will be composed of one or more gzip blocks, as per RFC 1952.

This function will place completed compression blocks in the output buffer and put CRC32 or CRC64 checksum for compressed input data in the user provided buffer **crc*.

The caller must check the updated *src_len*. This value will be the number of consumed bytes on exit. The calling API may have to process the destination buffer and call again.

The parameter *dest_len* will be set to the number of bytes produced in the destination buffer. This value may be zero if no data was produced which may occur if the consumed data is retained internally. A possible reason for this may be small amounts of data in the *src* buffer.

@context This function shall not be called in an interrupt context. @assumptions None @sideEffects None @blocking Yes @reentrant No @threadSafe Yes

Parameters

in	<i>sess</i>	Session handle (pointer to opaque instance and session data)
in	<i>src</i>	Point to source buffer
in, out	<i>src_len</i>	Length of source buffer. Modified to number of bytes consumed
in	<i>dest</i>	Point to destination buffer
in, out	<i>dest_len</i>	Length of destination buffer. Modified to length of compressed data when function returns
in	<i>last</i>	1 for 'No more data to be compressed' 0 for 'More data to be compressed'
in, out	<i>crc</i>	Pointer to CRC32 or CRC64 checksum buffer
in, out	<i>ext_rc</i>	qzCompressCrcExt or qzCompressCrc64Ext only. If not NULL, <i>ext_rc</i> point to a location where extended return codes may be returned. See extended return code section for details. if NULL, no extended information will be provided.

Return values

<i>QZ_OK</i>	Function executed successfully
<i>QZ_FAIL</i>	Function did not succeed
<i>QZ_PARAMS</i>	* <i>sess</i> is NULL or member of params is invalid

4.1.5.4 qzCompressStream() QATZIP_API int qzCompressStream (
    QzSession_T * sess,
    QzStream_T * strm,
    unsigned int last )

```

Compress data in stream and return checksum

@description This function will compress data in stream buffer if either a hardware based session or a software based session is available. If no session has been established - as indicated by the contents of *sess - then this function will attempt to set up a session using qzInit and qzSetupSession. The function will start to compress the data when receiving sufficient number of bytes - as defined by hw_buff_sz in QzSessionParams_T - or reaching the end of input data - as indicated by last parameter.

The resulting compressed block of data will be composed of one or more gzip blocks, per RFC 1952, or deflate blocks, per RFC 1951.

This function will place completed compression blocks in the *out of QzStream_T structure and put checksum for compressed input data in crc32 of QzStream_T structure.

The caller must check the updated in_sz of QzStream_T. This value will be the number of consumed bytes on exit. The calling API may have to process the destination buffer and call again.

The parameter out_sz in QzStream_T will be set to the number of bytes produced in the destination buffer. This value may be zero if no data was produced which may occur if the consumed data is retained internally. A possible reason for this may be small amounts of data in the src buffer.

The caller must check the updated pending_in of QzStream_T. This value will be the number of unprocessed bytes held in QATzip. The calling API may have to feed more input data or indicate reaching the end of input and call again.

The caller must check the updated pending_out of QzStream_T. This value will be the number of processed bytes held in QATzip. The calling API may have to process the destination buffer and call again.

@context This function shall not be called in an interrupt context. @assumptions None @sideEffects None @blocking Yes @reentrant No @threadSafe Yes

Parameters

in	sess	Session handle (pointer to opaque instance and session data)
in, out	strm	Stream handle
in	last	1 for 'No more data to be compressed' 0 for 'More data to be compressed' (always set to 1 in the Microsoft(R) Windows(TM) QATzip implementation)

Return values

QZ_OK	Function executed successfully
QZ_FAIL	Function did not succeed
QZ_PARAMS	*sess is NULL or member of params is invalid

```

Decompress a buffer and return the CRC checksum

@description This function will decompress a buffer if either a hardware based session or a software based session is available. If no session has been established - as indicated by the contents of *sess - then this function will attempt to set up a session using qzInit and qzSetupSession.

This function will place completed decompression chunks in the output buffer and put the CRC32 or CRC64 checksum for compressed input data in the user provided buffer *crc.

@context This function shall not be called in an interrupt context. @assumptions None @sideEffects None @blocking Yes @reentrant No @threadSafe Yes

Parameters

in	<i>sess</i>	Session handle (pointer to opaque instance and session data)
in	<i>src</i>	Point to source buffer
in	<i>src_len</i>	Length of source buffer. Modified to length of processed compressed data when function returns
in	<i>dest</i>	Point to destination buffer
in, out	<i>dest_len</i>	Length of destination buffer. Modified to length of decompressed data when function returns
in, out	<i>crc</i>	Pointer to CRC32 or CRC64 checksum buffer
in, out	<i>ext_rc</i>	qzDecompressCrcExt or qzDecompressCrc64Ext only. If not NULL, ext_rc point to a location where extended return codes may be returned. See extended return code section for details. if NULL, no extended information will be provided.

Return values

<i>QZ_OK</i>	Function executed successfully
<i>QZ_FAIL</i>	Function did not succeed
<i>QZ_PARAMS</i>	*sess is NULL or member of params is invalid

4.1.5.7 qzDecompressStream() `QATZIP_API int qzDecompressStream (`
 `QzSession_T * sess,`
 `QzStream_T * strm,`
 `unsigned int last)`

Decompress data in stream and return checksum

@description This function will decompress data in stream buffer if either a hardware based session or a software based session is available. If no session has been established - as indicated by the contents of *sess - then this function will attempt to set up a session using qzInit and qzSetupSession. The function will start to decompress the data when receiving sufficient number of bytes - as defined by hw_buff_sz in QzSessionParams_T - or reaching the end of input data - as indicated by last parameter.

The input compressed block of data will be composed of one or more gzip blocks, per RFC 1952, or deflate blocks, per RFC 1951.

This function will place completed decompression blocks in the *out of QzStream_T structure and put checksum for decompressed data in crc32 of QzStream_T structure.

The caller must check the updated in_sz of QzStream_T. This value will be the number of consumed bytes on exit. The calling API may have to process the destination buffer and call again.

The parameter out_sz in QzStream_T will be set to the number of bytes produced in the destination buffer. This value may be zero if no data was produced which may occur if the consumed data is retained internally. A possible reason for this may be small amounts of data in the src buffer.

The caller must check the updated pending_in of QzStream_T. This value will be the number of unprocessed bytes held in QATzip. The calling API may have to feed more input data or indicate reaching the end of input and call again.

The caller must check the updated pending_out of QzStream_T. This value will be the number of processed bytes held in QATzip. The calling API may have to process the destination buffer and call again.

@context This function shall not be called in an interrupt context. @assumptions None @sideEffects None @blocking Yes @reentrant No @threadSafe Yes

Parameters

in	<i>sess</i>	Session handle (pointer to opaque instance and session data)
in, out	<i>strm</i>	Stream handle
in	<i>last</i>	1 for 'No more data to be compressed' 0 for 'More data to be compressed'

Return values

<i>QZ_OK</i>	Function executed successfully
<i>QZ_FAIL</i>	Function did not succeed
<i>QZ_PARAMS</i>	*sess is NULL or member of params is invalid
<i>QZ_NEED_MORE</i>	*last is set but end of block is absent

4.1.5.14 qzGetStatus() `QATZIP_API int qzGetStatus (`
`QzSession_T * sess,`
`QzStatus_T * status)`

Get current QAT status

@description This function retrieves the status of QAT in the platform. The status structure will be filled in as follows: qat_hw_count Number of discovered QAT devices on PCU bus qat_service_init 1 if qzInit has been successfully run, 0 otherwise qat_mem_drvr 1 if the QAT memory driver is installed, 0 otherwise qat_instance_attach 1 if session has attached to a hardware instance, 0 otherwise memory_allocated Amount of memory, in kilobytes, from kernel or huge pages allocated by this process/thread. using_huge_pages 1 if memory is being allocated from huge pages, 0 if memory is being allocated from standard kernel memory hw_session_status Hw session status: one of: QZ_OK QZ_FAIL QZ_NO_HW QZ_NO_MDRV QZ_NO_INST_ATTACH QZ_LOW_MEM QZ_NOSW_NO_HW QZ_NOSW_NO_MDRV QZ_NOSW_NO_INST_ATTACH QZ_NOSW_LOW_MEM QZ_NO_SW_AVAIL

Applications should verify the elements of the status structure are correct for the required operations. It should be noted that some information will be available only after qzInit has been called, either implicitly or explicitly. The qat_service_init element of the status structure will indicate if initialization has taken place.

The hw_session_status will depend on the availability of hardware based compression and software based compression. The following table indicates what hw_session_status based on the availability of compression engines and the sw_backup flag.

| HW | SW Engine | sw_backup | hw_session_stat |

avail	avail	setting	
N	N	0	QZ_NOSW_NO_HW
N	N	1	QZ_NOSW_NO_HW
N	Y	0	QZ_FAIL
N	Y	1	QZ_NO_HW (1)
Y	N	0	QZ_OK
Y	N	1	QZ_NO_SW_AVAIL (2)
Y	Y	0	QZ_OK
Y	Y	1	QZ_OK

Note 1: If an application indicates software backup is required by setting `sw_backup=1`, and a software engine is available and if no hardware based compression engine is available then the `hw_session_status` will be set to `QZ_NO_HW`. All compression and decompression will use the software engine. Note 2: If an application indicates software backup is required by setting `sw_backup=1`, and if no software based compression engine is available then the `hw_session_status` will be set to `QZ_NO_SW_AVAIL`. In this case, QAT based compression may be used however no software backup will be available. If the application relies on software backup being available, then this return code can be treated as an error. @context This function shall not be called in an interrupt context. @assumptions None @sideEffects None @blocking Yes @reentrant No @threadSafe Yes

Parameters

in	<i>sess</i>	Session handle (pointer to opaque instance and session data)
in	<i>status</i>	Pointer to QATzip status structure

Return values

<code>QZ_OK</code>	Function executed successfully. The hardware based compression session has been created
<code>QZ_PARAMS</code>	*status is NULL

4.1.5.15 qzInit() `QATZIP_API int qzInit (`
 `QzSession_T * sess,`
 `unsigned char sw_backup)`

Initialize QAT hardware

@description This function initializes the QAT hardware. This function is optional in the function calling sequence. If desired, this call can be made to avoid latency impact during the first call to `qzDecompress` or `qzCompress`, or to set the `sw_backup` parameter explicitly. The input parameter `sw_backup` specifies the behavior of the function and that of the functions called with the same session in the event there are insufficient resources to establish a QAT based compression or decompression session.

The required resources include access to the QAT hardware, contiguous pinned memory for mapping the hardware rings, and contiguous pinned memory for buffers.

@context This function shall not be called in an interrupt context. @assumptions None @sideEffects This function will: 1) start the user space driver if necessary 2) allocate all hardware instances available @blocking Yes @reentrant No @threadSafe Yes

Parameters

in	<i>sess</i>	Session handle (pointer to opaque instance and session data.)
in	<i>sw_backup</i>	see QZ_SW_* definitions for expected behavior

Return values

<i>QZ_OK</i>	Function executed successfully. A hardware or software instance has been allocated to the calling process/thread
<i>QZ_DUPLICATE</i>	This process/thread already has a hardware instance
<i>QZ_PARAMS</i>	*sess is NULL
<i>QZ_NOSW_NO_HW</i>	No hardware and no software session being established
<i>QZ_NOSW_NO_MDRV</i>	No memory driver. No software session established
<i>QZ_NOSW_NO_INST_ATTACH</i>	No instance available No software session established
<i>QZ_NOSW_LOW_MEM</i>	Not enough pinned memory available No software session established
<i>QZ_UNSUPPORTED_FMT</i>	No support for requested algorithm; using software
<i>QZ_NOSW_UNSUPPORTED_FMT</i>	No support for requested algorithm; No software session established
<i>QZ_NO_SW_AVAIL</i>	No software is available. This will be returned when sw_backup is set but the session does not support software operations or software fallback is unavailable to the application.

```

Public Attributes

- `uint64_t` [polynomial](#)
- `uint64_t` [initial_value](#)
- `uint32_t` [reflect_in](#)
- `uint32_t` [reflect_out](#)
- `uint64_t` [xor_out](#)

5.1.1 Detailed Description

QATzip CRC64 configuration structure

@description This structure contains data relating to configuration of the sessions CRC64 functionality. Session defaults to using ECMA-182 Normal on creation.

5.1.2 Member Data Documentation

5.1.2.1 **initial_value** `uint64_t QzCrc64Config_S::initial_value`

Defaults to 0x0000000000000000

5.1.2.2 **polynomial** `uint64_t QzCrc64Config_S::polynomial`

Polynomial used for CRC64 calculation. Default 0x42F0E1EBA9EA3693

5.1.2.3 **reflect_in** `uint32_t QzCrc64Config_S::reflect_in`

Reflect bit order before CRC calculation. Default 0

5.1.2.4 **reflect_out** `uint32_t QzCrc64Config_S::reflect_out`

Reflect bit order after CRC calculation. Default 0

5.1.2.5 **xor_out** `uint64_t QzCrc64Config_S::xor_out`

Defaults to 0x0000000000000000

5.3.1 Detailed Description

QATzip Session Initialization parameters

@description This structure contains data for initializing a session.

5.3.2 Member Data Documentation

5.3.2.1 comp_algorithm `unsigned char QzSessionParams_S::comp_algorithm`

Compress/decompression algorithms

5.3.2.2 comp_lvl `unsigned int QzSessionParams_S::comp_lvl`

Compression level 1 to 9

5.3.2.3 data_fmt `QzDataFormat_T QzSessionParams_S::data_fmt`

Deflate, deflate with GZip or deflate with GZip ext

5.3.2.4 direction `QzDirection_T QzSessionParams_S::direction`

Compress or decompress

5.3.2.5 huffman_hdr `QzHuffmanHdr_T QzSessionParams_S::huffman_hdr`

Dynamic or Static Huffman headers

5.3.2.6 hw_buff_sz `unsigned int QzSessionParams_S::hw_buff_sz`

Default buffer size, must be a power of 2k 4K,8K,16K,32K,64K,128K

5.3.2.7 input_sz_threshold `unsigned int QzSessionParams_S::input_sz_threshold`

Default threshold of compression service's input size for sw failover, if the size of input request is less than the threshold, QATzip will route the request to software

5.3.2.8 max_forks `unsigned int QzSessionParams_S::max_forks`

Maximum forks permitted in the current thread 0 means no forking permitted

5.3.2.9 req_cnt_thrshold unsigned int QzSessionParams_S::req_cnt_thrshold

Set between 1 and NUM_BUFF, default NUM_BUFF NUM_BUFF is defined in qatzip_internal.h

5.3.2.10 strm_buff_sz unsigned int QzSessionParams_S::strm_buff_sz

Stream buffer size between [1K .. 2M - 5K] Default strm_buf_sz equals to hw_buff_sz

5.3.2.11 sw_backup unsigned char QzSessionParams_S::sw_backup

bit field defining SW configuration (see QZ_SW_* definitions)

5.3.2.12 wait_cnt_thrshold unsigned int QzSessionParams_S::wait_cnt_thrshold

When previous try failed, wait for specific number of calls before retrying to open device. Default threshold is 8

The documentation for this struct was generated from the following file:

5.4.1 Member Data Documentation

5.4.1.1 comp_algorithm unsigned char QzSessionParamsCommon_S::comp_algorithm

Compress/decompression algorithms

5.4.1.2 comp_lvl unsigned int QzSessionParamsCommon_S::comp_lvl

Compression level 1 to 9

5.4.1.3 direction QzDirection_T QzSessionParamsCommon_S::direction

Compress or decompress

5.4.1.4 hw_buff_sz unsigned int QzSessionParamsCommon_S::hw_buff_sz

Default buffer size, must be a power of 2k 4K,8K,16K,32K,64K,128K

5.4.1.5 input_sz_threshold unsigned int QzSessionParamsCommon_S::input_sz_threshold

Default threshold of compression service's input size for sw failover, if the size of input request is less than the threshold, QATzip will route the request to software

5.4.1.6 is_sensitive_mode unsigned int QzSessionParamsCommon_S::is_sensitive_mode

0 means disable sensitive mode, 1 means enable sensitive mode

5.4.1.7 max_forks unsigned int QzSessionParamsCommon_S::max_forks

Maximum forks permitted in the current thread 0 means no forking permitted

5.4.1.8 polling_mode QzPollingMode_T QzSessionParamsCommon_S::polling_mode

0 means no busy polling, 1 means busy polling

5.4.1.9 req_cnt_threshold unsigned int QzSessionParamsCommon_S::req_cnt_threshold

Set between 1 and NUM_BUFF, default NUM_BUFF NUM_BUFF is defined in qatzip_internal.h

5.4.1.10 strm_buff_sz unsigned int QzSessionParamsCommon_S::strm_buff_sz

Stream buffer size between [1K .. 2M - 5K] Default strm_buf_sz equals to hw_buff_sz

5.4.1.11 sw_backup unsigned char QzSessionParamsCommon_S::sw_backup

bit field defining SW configuration (see QZ_SW_* definitions)

5.4.1.12 wait_cnt_threshold unsigned int QzSessionParamsCommon_S::wait_cnt_threshold

When previous try failed, wait for specific number of calls before retrying to open device. Default threshold is 8

5.9.1 Detailed Description

QATzip status structure

@description This structure contains data relating to the status of QAT on the platform.

5.9.2 Member Data Documentation

5.9.2.1 [algo_hw](#) unsigned char QzStatus_S::algo_hw[[QZ_MAX_ALGORITHMS](#)]

Count of hardware devices supporting algorithms

5.9.2.2 [algo_sw](#) unsigned char QzStatus_S::algo_sw[[QZ_MAX_ALGORITHMS](#)]

Support software algorithms

5.9.2.3 [hw_session_status](#) signed long int QzStatus_S::hw_session_status

One of QATzip Session Status

5.9.2.4 [memory_allocated](#) unsigned long int QzStatus_S::memory_allocated

Amount of memory allocated by this thread/process

5.9.2.5 [qat_hw_count](#) unsigned short int QzStatus_S::qat_hw_count

From PCI scan

5.9.2.6 qat_instance_attach unsigned char QzStatus_S::qat_instance_attach

Is this thread/g_process properly attached to an Instance?

5.9.2.7 qat_mem_drvr unsigned char QzStatus_S::qat_mem_drvr

1 if /dev/qat_mem exists 2 if /dev/qat_mem has been opened 0 otherwise

5.9.2.8 qat_service_init unsigned char QzStatus_S::qat_service_init

Check if the available services have been initialized

5.9.2.9 using_huge_pages unsigned char QzStatus_S::using_huge_pages

Are memory slabs coming from huge pages?

The documentation for this struct was generated from the following file:

- applications.qat.shims.qatzip.qatzip/include/qatzip.h

5.10 QzStream_S Struct Reference

5.10.1 Detailed Description

QATzip Stream data storage

@description This structure contains metadata needed for stream operation.

5.10.2 Member Data Documentation

5.10.2.1 **crc_32** `unsigned int QzStream_S::crc_32`

Checksum value

5.10.2.2 **crc_type** `QzCrcType_T QzStream_S::crc_type`

Checksum type in Adler, CRC32 or none

5.10.2.3 **in** `unsigned char* QzStream_S::in`

Input data pointer set by application

5.10.2.4 **in_sz** `unsigned int QzStream_S::in_sz`

Set by application, reset by QATzip to indicate consumed data

5.10.2.5 **opaque** `void* QzStream_S::opaque`

Internal storage managed by QATzip

5.10.2.6 **out** `unsigned char* QzStream_S::out`

Output data pointer set by application

5.10.2.7 **out_sz** `unsigned int QzStream_S::out_sz`

Set by application, reset by QATzip to indicate processed data

5.10.2.8 **pending_in** `unsigned int QzStream_S::pending_in`

Unprocessed bytes held in QATzip

5.10.2.9 **pending_out** `unsigned int QzStream_S::pending_out`

Processed bytes held in QATzip

5.10.2.10 **reserved** `unsigned long long QzStream_S::reserved`

Reserved for future use

6.1.1 Macro Definition Documentation

6.1.1.1 MIN `#define MIN(`
`a,`
`b) ((a)<(b))?(a):(b)`

6.1.1.2 QATZIP_API `#define QATZIP_API`

These macros define how the project will be built **QATZIP_LINK_DLL** must be defined if linking the DLL **QATZIP_BUILD_DLL** must be defined when building a DLL No definition required if building the project as static library

6.1.1.3 QATZIP_API_VERSION `#define QATZIP_API_VERSION`

Value:

```
(QATZIP_API_VERSION_NUM_MAJOR * 10000 + \
QATZIP_API_VERSION_NUM_MINOR * 100)
```

6.1.1.4 QZ_BUF_ERROR `#define QZ_BUF_ERROR (-3)`

Insufficient buffer error

6.1.1.5 QZ_COMP_ALGOL_DEFAULT `#define QZ_COMP_ALGOL_DEFAULT QZ_DEFLATE`**6.1.1.6 QZ_COMP_LEVEL_DEFAULT** `#define QZ_COMP_LEVEL_DEFAULT 1`**6.1.1.7 QZ_COMP_THRESHOLD_DEFAULT** `#define QZ_COMP_THRESHOLD_DEFAULT 1024`**6.1.1.8 QZ_COMP_THRESHOLD_MINIMUM** `#define QZ_COMP_THRESHOLD_MINIMUM 128`**6.1.1.9 QZ_COMPRESSED_SZ_OF_EMPTY_FILE** `#define QZ_COMPRESSED_SZ_OF_EMPTY_FILE 34`**6.1.1.10 QZ_DATA_ERROR** `#define QZ_DATA_ERROR (-4)`

Input data was corrupted

6.1.1.11 QZ_DATA_FORMAT_DEFAULT `#define QZ_DATA_FORMAT_DEFAULT QZ_DEFLATE_GZIP_EXT`**6.1.1.12 QZ_DEFLATE** `#define QZ_DEFLATE ((unsigned char)8)`

used in gzip header to indicate deflate blocks and in session params

6.1.1.13 QZ_DEFLATE_COMP_LVL_MAXIMUM `#define QZ_DEFLATE_COMP_LVL_MAXIMUM (9)`

6.1.1.14 QZ_DEFLATE_COMP_LVL_MAXIMUM_Gen3 `#define QZ_DEFLATE_COMP_LVL_MAXIMUM_Gen3 (12)`

6.1.1.15 QZ_DEFLATE_COMP_LVL_MINIMUM `#define QZ_DEFLATE_COMP_LVL_MINIMUM (1)`

6.1.1.16 QZ_DIRECTION_DEFAULT `#define QZ_DIRECTION_DEFAULT QZ_DIR_BOTH`

6.1.1.17 QZ_DISABLE_SOFTWARE_BACKUP `#define QZ_DISABLE_SOFTWARE_BACKUP (`
`_BackupVariable) (_BackupVariable &= ~(1 << QZ_SW_BACKUP_BIT_POSITION))`

SW backup/fallback disabled

6.1.1.18 QZ_DISABLE_SOFTWARE_ONLY_EXECUTION `#define QZ_DISABLE_SOFTWARE_ONLY_EXECUTION (`
`_BackupVariable) (_BackupVariable &= ~(1 << QZ_SW_FORCESW_BIT_POSITION))`

Disable SW only compression/decompression operations

6.1.1.19 QZ_DUPLICATE `#define QZ_DUPLICATE (1)`

Can not process function again. No failure

6.1.1.20 QZ_ENABLE_SOFTWARE_BACKUP `#define QZ_ENABLE_SOFTWARE_BACKUP (`
`_BackupVariable) (_BackupVariable |= (1 << QZ_SW_BACKUP_BIT_POSITION))`

SW backup/fallback enabled

6.1.1.21 QZ_ENABLE_SOFTWARE_ONLY_EXECUTION `#define QZ_ENABLE_SOFTWARE_ONLY_EXECUTION (`
`_BackupVariable) (_BackupVariable |= (1 << QZ_SW_FORCESW_BIT_POSITION))`

Force SW to perform all compression/decompression operations

6.1.1.22 QZ_FAIL `#define QZ_FAIL (-2)`

Unspecified error

6.1.1.23 QZ_FORCE_SW `#define QZ_FORCE_SW (2)`

Using SW: Switch to software because of previous block

6.1.1.24 QZ_HUFF_HDR_DEFAULT `#define QZ_HUFF_HDR_DEFAULT QZ_DYNAMIC_HDR`

6.1.1.25 QZ_HW_BUFF_MAX_SZ `#define QZ_HW_BUFF_MAX_SZ (512*1024)`

6.1.1.26 QZ_HW_BUFF_MAX_SZ_Gen3 `#define QZ_HW_BUFF_MAX_SZ_Gen3 (2*1024*1024*1024U)`

6.1.1.27 QZ_HW_BUFF_MIN_SZ `#define QZ_HW_BUFF_MIN_SZ (1*1024)`

6.1.1.28 QZ_HW_BUFF_SZ `#define QZ_HW_BUFF_SZ (64*1024)`

6.1.1.29 QZ_HW_BUFF_SZ_Gen3 `#define QZ_HW_BUFF_SZ_Gen3 (1*1024*1024)`

6.1.1.30 QZ_HW_TIMEOUT `#define QZ_HW_TIMEOUT(
 ret,
 ext_rc) (!ret && (ext_rc & QZ_TIMEOUT_MASK))`

6.1.1.31 QZ_INTEG `#define QZ_INTEG (-100)`

Integrity checked failed

6.1.1.32 QZ_LOW_DEST_MEM `#define QZ_LOW_DEST_MEM (15)`

Using SW: Not enough pinned memory for dest buffer

6.1.1.33 QZ_LOW_MEM `#define QZ_LOW_MEM (14)`

Using SW: Not enough pinned memory

6.1.1.34 QZ_LZ4 `#define QZ_LZ4 ((unsigned char)'4')`

6.1.1.35 QZ_LZ4s `#define QZ_LZ4s ((unsigned char)'s')`

6.1.1.36 QZ_LZS_COMP_LVL_MAXIMUM `#define QZ_LZS_COMP_LVL_MAXIMUM (12)`

6.1.1.37 QZ_LZS_COMP_LVL_MINIMUM `#define QZ_LZS_COMP_LVL_MINIMUM (1)`

6.1.1.38 QZ_MAX_ALGORITHMS `#define QZ_MAX_ALGORITHMS ((int)255)`

6.1.1.39 QZ_MAX_FORK_DEFAULT `#define QZ_MAX_FORK_DEFAULT 3`

6.1.1.40 QZ_NO_HW `#define QZ_NO_HW (11)`

Using SW: No QAT HW detected

6.1.1.41 QZ_NO_INST_ATTACH `#define QZ_NO_INST_ATTACH (13)`

Using SW: Could not attach to an instance

6.1.1.42 QZ_NO_MDRV `#define QZ_NO_MDRV (12)`

Using SW: No memory driver detected

6.1.1.43 QZ_NO_SW_AVAIL `#define QZ_NO_SW_AVAIL (-105)`

Session may require software, but no software is available

6.1.1.44 QZ_NONE `#define QZ_NONE (100)`

Device uninitialized

6.1.1.45 QZ_NOSW_LOW_MEM `#define QZ_NOSW_LOW_MEM (-104)`

Not using SW: not enough pinned memory

6.1.1.46 QZ_NOSW_NO_HW `#define QZ_NOSW_NO_HW (-101)`

Not using SW: No QAT HW detected

6.1.1.47 QZ_NOSW_NO_INST_ATTACH `#define QZ_NOSW_NO_INST_ATTACH (-103)`

Not using SW: Could not attach to instance

6.1.1.48 QZ_NOSW_NO_MDRV `#define QZ_NOSW_NO_MDRV (-102)`

Not using SW: No memory driver detected

6.1.1.49 QZ_NOSW_UNSUPPORTED_FMT `#define QZ_NOSW_UNSUPPORTED_FMT (-116)`

Not using SW: QAT device does not support data format

6.1.1.50 QZ_PARAMS `#define QZ_PARAMS (-1)`

Invalid parameter in function call

6.1.1.51 QZ_POLL_SLEEP_DEFAULT `#define QZ_POLL_SLEEP_DEFAULT 10`

6.1.1.52 QZ_POST_PROCESS_ERROR `#define QZ_POST_PROCESS_ERROR (-117)`

Using post process: post process callback encountered an error

6.1.1.53 QZ_POST_PROCESS_FAIL `#define QZ_POST_PROCESS_FAIL(
 ret,
 ext_rc) (ret && (ext_rc & QZ_POST_PROCESS_FAIL_MASK))`

6.1.1.54 QZ_POST_PROCESS_FAIL_BIT `#define QZ_POST_PROCESS_FAIL_BIT (10)`

6.1.1.55 QZ_POST_PROCESS_FAIL_MASK `#define QZ_POST_PROCESS_FAIL_MASK (1 << QZ_POST_PROCESS_FAIL_BIT)`

6.1.1.56 QZ_REQ_THRESHOLD_DEFAULT `#define QZ_REQ_THRESHOLD_DEFAULT QZ_REQ_THRESHOLD_MAXIMUM`

6.1.1.57 QZ_REQ_THRESHOLD_MAXIMUM `#define QZ_REQ_THRESHOLD_MAXIMUM NUM_BUFF`

6.1.1.58 QZ_REQ_THRESHOLD_MINIMUM `#define QZ_REQ_THRESHOLD_MINIMUM 1`

6.1.1.59 QZ_STRM_BUFF_MAX_SZ `#define QZ_STRM_BUFF_MAX_SZ (2*1024*1024 - 5*1024)`

6.1.1.60 QZ_STRM_BUFF_MIN_SZ `#define QZ_STRM_BUFF_MIN_SZ (1*1024)`

6.1.1.61 QZ_STRM_BUFF_SZ_DEFAULT `#define QZ_STRM_BUFF_SZ_DEFAULT QZ_HW_BUFF_SZ`

6.1.1.62 QZ_SW_BACKUP_DEFAULT `#define QZ_SW_BACKUP_DEFAULT 1`

6.1.1.63 QZ_SW_EXECUTION `#define QZ_SW_EXECUTION(
 ret,
 ext_rc) (!ret && (ext_rc & QZ_SW_EXECUTION_MASK))`

6.1.1.64 QZ_SW_EXECUTION_MASK `#define QZ_SW_EXECUTION_MASK (1 << QZ_SW_EXECUTION_BIT)`

6.1.1.65 QZ_SW_FORCESW_BIT_POSITION `#define QZ_SW_FORCESW_BIT_POSITION (1)`

6.1.1.66 QZ_TIMEOUT `#define QZ_TIMEOUT (-5)`

Operation timed out

6.1.1.67 QZ_TIMEOUT_BIT `#define QZ_TIMEOUT_BIT (8)`

6.1.1.68 QZ_TIMEOUT_MASK `#define QZ_TIMEOUT_MASK (1 << QZ_TIMEOUT_BIT)`

6.1.1.69 QZ_UNSUPPORTED_FMT `#define QZ_UNSUPPORTED_FMT (16)`

Using SW: QAT device does not support data format

6.1.1.70 QZ_WAIT_CNT_THRESHOLD_DEFAULT `#define QZ_WAIT_CNT_THRESHOLD_DEFAULT 8`

6.1.1.71 QZ_ZSTD `#define QZ_ZSTD ((unsigned char)'Z')`

6.1.2 Typedef Documentation

6.1.2.1 QzSessionParamsCommon_T `typedef struct QzSessionParamsCommon_S QzSessionParamsCommon_T`

6.1.2.2 QzSessionParamsDeflate_T `typedef struct QzSessionParamsDeflate_S QzSessionParamsDeflate_T`

6.1.2.3 QzSessionParamsLZ4_T `typedef struct QzSessionParamsLZ4_S QzSessionParamsLZ4_T`

6.1.2.4 QzSessionParamsLZ4S_T `typedef struct QzSessionParamsLZ4S_S QzSessionParamsLZ4S_T`

6.1.2.5 QzSoftwareVersionInfo_T `typedef struct QzSoftwareVersionInfo_S QzSoftwareVersionInfo_T`

6.1.3 Function Documentation

6.1.3.1 qzCompressCrc64() `QATZIP_API int qzCompressCrc64 (`
 `QzSession_T * sess,`
 `const unsigned char * src,`
 `unsigned int * src_len,`
 `unsigned char * dest,`
 `unsigned int * dest_len,`
 `unsigned int last,`
 `uint64_t * crc)`

6.1.3.2 qzCompressCrc64Ext() `QATZIP_API int qzCompressCrc64Ext (`
 `QzSession_T * sess,`
 `const unsigned char * src,`
 `unsigned int * src_len,`
 `unsigned char * dest,`
 `unsigned int * dest_len,`
 `unsigned int last,`
 `uint64_t * crc,`
 `uint64_t * ext_rc)`

6.1.3.3 qzCompressCrcExt() `QATZIP_API int qzCompressCrcExt (`
 `QzSession_T * sess,`
 `const unsigned char * src,`
 `unsigned int * src_len,`
 `unsigned char * dest,`
 `unsigned int * dest_len,`
 `unsigned int last,`
 `unsigned long * crc,`
 `uint64_t * ext_rc)`

6.1.3.4 qzCompressExt() `QATZIP_API int qzCompressExt (`
 `QzSession_T * sess,`
 `const unsigned char * src,`
 `unsigned int * src_len,`
 `unsigned char * dest,`
 `unsigned int * dest_len,`
 `unsigned int last,`
 `uint64_t * ext_rc)`

6.1.3.5 qzDecompressCrc64() `QATZIP_API int qzDecompressCrc64 (`
 `QzSession_T * sess,`
 `const unsigned char * src,`
 `unsigned int * src_len,`
 `unsigned char * dest,`
 `unsigned int * dest_len,`
 `uint64_t * crc)`

6.1.3.6 qzDecompressCrc64Ext() `QATZIP_API int qzDecompressCrc64Ext (`
 `QzSession_T * sess,`
 `const unsigned char * src,`
 `unsigned int * src_len,`
 `unsigned char * dest,`
 `unsigned int * dest_len,`
 `uint64_t * crc,`
 `uint64_t * ext_rc)`

6.1.3.7 qzDecompressCrcExt() `QATZIP_API int qzDecompressCrcExt (`
 `QzSession_T * sess,`
 `const unsigned char * src,`
 `unsigned int * src_len,`
 `unsigned char * dest,`
 `unsigned int * dest_len,`
 `unsigned long * crc,`
 `uint64_t * ext_rc)`

6.1.3.8 qzDecompressExt() `QATZIP_API int qzDecompressExt (`
 `QzSession_T * sess,`
 `const unsigned char * src,`
 `unsigned int * src_len,`
 `unsigned char * dest,`
 `unsigned int * dest_len,`
 `uint64_t * ext_rc)`

6.1.3.9 qzGetDefaultsDeflate() `QATZIP_API int qzGetDefaultsDeflate (`
 `QzSessionParamsDeflate_T * defaults)`

6.1.3.10 qzGetDefaultsLZ4() `QATZIP_API int qzGetDefaultsLZ4 (`
 `QzSessionParamsLZ4_T * defaults)`

6.1.3.11 qzGetDefaultsLZ4S() `QATZIP_API int qzGetDefaultsLZ4S (`
 `QzSessionParamsLZ4S_T * defaults)`

6.1.3.12 qzMaxCompressedLength() `QATZIP_API unsigned int qzMaxCompressedLength (`
 `unsigned int src_sz,`
 `QzSession_T * sess)`

6.1.3.13 qzSetDefaultsDeflate() `QATZIP_API int qzSetDefaultsDeflate (`
 `QzSessionParamsDeflate_T * defaults)`

6.1.3.14 qzSetDefaultsLZ4() `QATZIP_API int qzSetDefaultsLZ4 (`
 `QzSessionParamsLZ4_T * defaults)`

6.1.3.15 qzSetDefaultsLZ4S() `QATZIP_API int qzSetDefaultsLZ4S (`
`QzSessionParamsLZ4S_T * defaults)`

6.1.3.16 qzSetupSessionDeflate() `QATZIP_API int qzSetupSessionDeflate (`
`QzSession_T * sess,`
`QzSessionParamsDeflate_T * params)`

6.1.3.17 qzSetupSessionLZ4() `QATZIP_API int qzSetupSessionLZ4 (`
`QzSession_T * sess,`
`QzSessionParamsLZ4_T * params)`

6.1.3.18 qzSetupSessionLZ4S() `QATZIP_API int qzSetupSessionLZ4S (`
`QzSession_T * sess,`
`QzSessionParamsLZ4S_T * params)`
